### 20 Things You Didn't Know About... Elections

Humans have a record of screwing up democracy, but we aren't the only species getting in on the act.

by LeeAundra Temescu

From the November 2008 issue, published online November 3, 2008

1 Ancient Greece was not the birthplace of democracy. Two thousand years earlier in the kingdom of [Ebla](#), located in what is now Syria, kings were elected for seven-year terms.

2 Humans are not the only ones that vote. When it is time to find a new hive, [honeybees](#) vote for the best location, even though they can't count. After scouts return from casing possible sites, they dance. The bees that dance most vigorously will recruit other scouts until one site wins.

3 Divining the human decision-making process is tougher. The first election poll in the United States was conducted in 1824 by the *Harrisburg Pennsylvanian* newspaper. It accurately predicted that Andrew Jackson

would win the most votes in the presidential race, but...

advertisement | article continues below

4 ...unfortunately, the poll didn't predict the winner, because Jackson didn't get enough votes in the electoral college. The House of Representatives gave the presidency to John Quincy Adams.

5 On election night in 1952, TV viewers saw Walter Cronkite sitting beside [UNIVAC 1](#), which famously called the race for Eisenhower after only 7 percent of the vote had been tallied.

6 Not quite. Cronkite sat beside a cardboard panel with blinking Christmas lights. The real computer was projecting returns in Pennsylvania.

7 In 2007 neuroscientists examined the [brain activity of undecided voters](#) as they viewed the leading presidential candidates in the race.

8 The two candidates who elicited the least amount of activity? John McCain and Barack Obama.

9 Belgium, with compulsory voting, punishes those who have missed four elections in 15 years by...not letting them vote for 10 years. Are we missing something here?

10 Think that's confusing? Consider the Venetians. For more than 500 years the doge of Venice was selected by 30 members of the Great Council who were chosen by lot, who were then reduced by lot to 9, who then chose 40, who were then reduced by lot to 12...

- 11 ...who then chose 25, who were reduced by lot to 9, who then elected 45, who were reduced by lot to 11...
- 12 ...who then chose the 41 who (gasp!) finally elected the doge. We are assured by researchers that this actually worked reasonably well in avoiding corruption and the influence of special interests.
- 13 The [lever voting machine](#) [pdf] was invented by Jacob H. Myers and was first used in 1892 in Lockport, New York. Myers said it was designed to "make the process of casting the ballot perfectly plain, simple, and secret."
- 14 At the time, the machine had more moving parts than nearly any other contraption in the United States.
- 15 It's not getting any simpler. [The Swiss used quantum physics](#) to help safeguard a 2007 election. The keys to encrypted electronic voting returns were transmitted using polarized photons.
- 16 For the 2006 elections, the Department of Defense launched a Web-based voting system for overseas military personnel and American expatriates. The system cost more than \$830,000; 63 people used it to vote.
- 17 Ballot layout matters. There's the "vertical proximity effect," whereby unknown candidates whose names appear near those of popular candidates get extra votes.
- 18 And then there's a tendency among voters simply to vote for the first name on the ballot. In Australia, where voting is compulsory, these votes could account for as much as 1 percent of the total.
- 19 Rain can tilt elections. Between 1948 and 2000, for every inch of rain on Election Day in a given county, there was an average 0.8 percent decline in turnout.
- 20 Computer modeling has indicated that if it had rained in Illinois in 1960, Nixon would have beaten Kennedy—and if it had been sunny in Florida in 2000, Gore would have beaten Bush.
